

# cmdReporter

cmdReporter works like a security motion detector for anything running on, communicating with, or authenticating into a macOS computer.

cmdReporter collects security information while conserving macOS' natural resources, so more computer is available to the user.

- **Why is cmdReporter different?**

Our founder wrote the security guidance for macOS for the U.S. government and has spent the last decade studying macOS security. cmdReporter focuses on preserving the speed and stability of macOS while still providing the protection that organizations require.

- **Privacy with security**

The default log level focuses on maintaining user privacy while still collecting all necessary security data. Higher collection levels can collect all computer and user activity.

- **JSON output**

Get the right data, to the right people, in the proper format, faster. Nearly all security tools will natively ingest JSON without special data manipulation.

- **Continuously streaming data**

cmdReporter was designed to collect and process data from your endpoints in real-time. Security teams can immediately know if there are ever any issues.

- **No kernel extension necessary**

cmdReporter runs without kernel-level permissions which avoids a long list of security and stability concerns. cmdReporter can be deployed as one version for all macOS computers in your environment instead of matching application versions to kernel versions.

- **Never calls home**

No log data is ever sent to cmdSecurity or external servers. Your data stays within your organization.

- **Light footprint**

cmdReporter is designed with macOS resource conservation as a key requirement and the majority of users will never notice cmdReporter running. An average of 10mb of log data is generated each day for macOS endpoints which means no more unusably slow computers due to security software.

- **Government compliance**

Log collection levels are mapped to NIST's published risk management framework (SP 800-37) and collect the recommended level of information.
